

India: Geographical Features

Introduction

India is a land of remarkable geographical diversity, often called a "subcontinent" due to its vast size and distinct physical features. Located in South Asia between 8°4' N to 37°6' N latitude and 68°7' E to 97°25' E longitude, it covers 3.28 million sq km - the 7th largest country by area. This chapter explores India's majestic mountains, fertile plains, rugged plateaus, and coastal regions that shape its climate, resources, and human settlements.

A[Geographical Diversity] --> B[6 Physical Divisions]
A --> C[7 Climate Zones]
A --> D[12 Major River Systems]

1. Physical Divisions

A. The Great Himalayan Range

- **Three parallel ranges:**
 1. **Himadri** (Greater Himalayas) - Mt. Everest (8849m)
 2. **Himachal** (Lesser Himalayas) - Hill stations like Shimla
 3. **Shiwalik** - Youngest and outermost range

Ecological Importance:

- "Water tower of Asia" (Ganges, Indus, Brahmaputra originate here)
- Blocks cold Central Asian winds

B. Northern Plains

| Section | Rivers | Fertility Level |
|--------------------|----------------|--------------------------------|
| Punjab Plains | Satluj, Beas | Highly fertile (Alluvial soil) |
| Ganga Plains | Ganges, Yamuna | Most agriculturally productive |
| Brahmaputra Valley | Brahmaputra | Prone to floods |

2. Peninsular India

Deccan Plateau Features:

- Rich in black soil (ideal for cotton)
- Bordered by Western & Eastern Ghats
- Contains mineral wealth (iron, bauxite)

Coastal Comparison:

| West Coast | East Coast |
|---------------|--------------------------------|
| Narrow, steep | Wide, deltas |
| Fewer ports | Major ports (Chennai, Kolkata) |

3. River Systems

Himalayan vs Peninsular Rivers:

| Feature | Himalayan | Peninsular |
|---------|-----------|------------|
| Origin | Glaciers | Rainfall |
| Flow | Perennial | Seasonal |
| Example | Ganges | Godavari |

Importance:

- Irrigation (60% agriculture dependent)
 - Hydropower (Bhakra Nangal, Tehri dams)
 - Cultural significance (Ganges is sacred)
-

4. Climate & Vegetation

Seasonal Cycle:

Annual Seasons

"Winter (Dec-Feb)" : 20
"Summer (Mar-May)" : 25
"Monsoon (Jun-Sep)" : 50
"Post-Monsoon (Oct-Nov)" : 5

Natural Vegetation Types:

1. Tropical Evergreen (Western Ghats)
 2. Deciduous (Central India)
 3. Desert (Thar)
 4. Mangrove (Sundarbans)
-

Case Study: Thar Desert

Unique Features:

- World's most densely populated desert
- Contains India's largest saltwater lake (Sambhar)

Adaptations:

Camel breeding
Drought-resistant crops (millet)

Chapter Summary

- ✓ **6 Physical Divisions** shape India's landscape
 - ✓ **Rivers** are lifelines for agriculture and culture
 - ✓ **Monsoon** dominates climate patterns
 - ✓ **Resource distribution** varies regionally
-

Activities

1. **Map Work:**

- Mark: Highest peak in each zone
- Shade: Major soil types

2. **Project:**

Create a "Rainfall Diary" comparing your region with Cherrapunji
